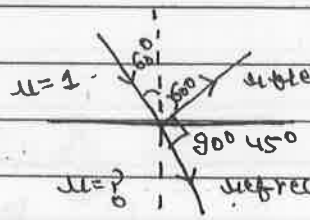
Q1 In a given situation light enters into air having $\angle i = 60^\circ$. If reflected ray and refracted ray are mutually perpendicular then find out the ref. index of air?



** $\because \angle i = \angle r$

Solve: $60^\circ + 90^\circ + x = 180^\circ$

$150^\circ + x = 180$

$\boxed{x = 30^\circ}$

$1 \times \sin 60^\circ = \mu \times \sin 30^\circ$

$1 \times \frac{\sqrt{3}}{2} = \mu \times \frac{1}{2}$

$\boxed{\mu = \sqrt{3}}$

Q2 Light enters from denser medium μ into air. If the angle of incidence is half of angle of refraction then calculated the angle of refraction?

$\mu \sin\frac{\theta}{2} = 1 \times \sin\theta$

* Important

$\mu \sin\frac{\theta}{2} = \sin\theta$

$\sin 2\theta = 2\sin\theta\cos\theta$

$\sin\theta = 2\sin\frac{\theta}{2}\cos\frac{\theta}{2}$ $\quad \mu\sin\frac{\theta}{2} = 2\sin\frac{\theta}{2}\cos\frac{\theta}{2}$

$\frac{\mu}{2} = \cos\frac{\theta}{2}$

$\cos^{-1}\left(\frac{\mu}{2}\right) = \frac{\theta}{2}$

$\boxed{2\cos^{-1}\left(\frac{\mu}{2}\right) = \theta}$

Total Internal Reflection (TIR) :-

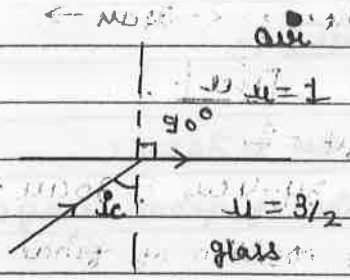
$i > i_c$

TIR.



$\frac{3}{2} \sin i_c = 1 \times \sin 90°$

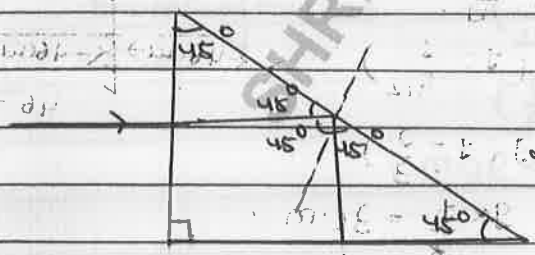
$\sin i_c = 2/3$

$\boxed{i_c = \sin^{-1}(2/3)}$

NCERT. $\boxed{i_c = 41°}$

Conditions For TIR :-

1. The ray must travel from denser medium to rarer medium.
2. The angle of incidence must be greater than critical angle.



$i > i_c$

$45° > 41°$

Hence TIR.

Angle of incidence $= 45°$

If ray comes at 90° then it goes straight.

$\mu \sin i = 1 \sin r$

$\mu \sin i = \sin(90 - i)$

Q. If light travels a distance $5x$ in time t_1 in air and distance $7x$ time t_2 in a certain medium then calculated the critical angle for that medium?

$\mu_1 = c \, t_1 / 5x$

Let velocity in air be $v_1 = \frac{5x}{t_1}$

velocity in medium $v_2 = \frac{7x}{t_2}$

$\mu_2 = \frac{c}{v_2} = \frac{c \times t_2}{7x}$

$\mu_2 = \frac{c t_2}{7x}$

critical angle $= \mu_2 \sin i_c = \mu_1 \sin 90^\circ$

$= \frac{c t_2}{7x} \sin i_c = \frac{c t_1}{5x} \times 1$

$= \sin i_c = \frac{c t_1}{5x} \times \frac{7x}{c t_2}$

A equiconvex lense has a radius of curvature 20cm. An object is place at a distance of 30cm from a lense and height of object is 2cm then describe the properties of image?

solve.

$\mu = 3/2$

$\frac{1}{f} = \left[\frac{3}{2}\right]\left[\frac{1}{R_1} - \left(\frac{-1}{R_2}\right)\right]$

$\frac{1}{f} = \frac{1}{2}\left[\frac{2}{20}\right]$

$\boxed{f = 20cm}$

lense is convex.

object $u = -30cm$ · [real object]

$\frac{1}{v} - \frac{1}{u} = \frac{1}{f}$.

$\frac{1}{v} - \left(\frac{-1}{30}\right) = \frac{1}{20}$.

$\frac{30 + v}{30v} = \frac{1}{20}$

$600 + 20v = 30v$

$60\phi = 10v$ $\boxed{v = 60cm}$

$\frac{H_I}{H_O} = \frac{60}{-30} \cdot 2$

$\boxed{H_I = -4cm}$.

Q2 lenses of diopter 3D and -5 diopter form compound lense. An object is placed at distance of 50cm from lense, then calculate the position of image?

solve $P_{net} = P_1 + P_2$

$= 3D + (-5D) = -2D$.

$\frac{1}{f} = P$.

$f = -\frac{1}{2}cm$.

$f = \frac{100}{-2}$.

$\boxed{f = -50cm}$.

$\frac{1}{v} - \frac{1}{u} = \frac{1}{f}$.

$\frac{1}{v} - \left(\frac{-1}{50}\right) = \frac{-1}{50}$.

$\frac{1}{v} + \frac{1}{50} = -\frac{1}{50}$.

$\frac{1}{v} = -\frac{1}{50} - \frac{1}{50} = \frac{1}{v} = \frac{-1-1}{50}$

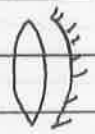
Ans



$P_{net} = P_1 + P_2 + P_3$

$\frac{-1}{f_{net}} = \frac{1}{L} + \frac{1}{m} + \frac{1}{L}$

$\frac{-1}{f_{net}} = \frac{2}{L} + \frac{1}{m}$

$\frac{1}{f_L} = (\mu - 1)\left[\frac{1}{R} + \frac{1}{R}\right]$

$\frac{1}{f_L} = (\mu - 1) \times \frac{2}{R}$

$\boxed{f_L = \frac{R}{2(\mu - 1)}}$

$f_m = -\frac{R}{2}$

$-\frac{1}{f_{net}} = \frac{2}{\frac{R}{2(\mu-1)}} - \frac{1}{-R/2}$
